Business Case Document
Telco Customer Churn Analysis Dashboard

1. Executive Summary

The Telco business is currently facing significant customer churn, especially among fiber optic internet users, month-to-month contract holders, and customers who do not use automatic payment methods. Existing reports are primarily spreadsheet-based, static, and lack detailed insights into customer behavior.

To address this, the project focuses on building an interactive churn analysis dashboard that helps identify key churn drivers, highlight at-risk customer segments, and support targeted retention strategies. The solution uses the Telco Customer Churn dataset from Kaggle as the primary data source.

2. Business Problem

Customer churn is having a direct impact on revenue and long-term customer value. Currently, the business lacks clarity on:

- Which customer segments (e.g., contract type, internet service) show the highest churn rates
- How churn varies across payment method, tenure, and monthly charges
- Which customers are most likely to churn and should be prioritized
- How effective current retention strategies are over time

3. Project Objective

The objective of this project is to develop a Power BI dashboard using the Telco Customer Churn dataset. It enables leadership to monitor churn trends, identify high-risk segments, and understand how service type, tenure, and billing behavior influence customer retention.

4. Key Metrics & KPIs

A. Churn Overview

- Overall Churn Rate (%)
- Monthly Charges vs Churn Rate
- Churn Rate by Contract Type (Month-to-Month, One Year, Two Year)
- Churn by Internet Service (DSL, Fiber Optic, None)

B. Risk Segmentation

- High-Risk Segment Counts

- Churn by Tenure Groups
- Payment Method vs Churn
- AutoPay vs Manual Payment Churn Comparison

C. Customer Profile Analysis

- Senior Citizen Impact on Churn
- Dependents and Partner Influence
- Services Subscribed vs Churn Likelihood
- Gender and Demographic Patterns

D. Retention Opportunities

- Top Factors Influencing Churn (Based on Correlation or Machine Learning)
- Customers Near Churn Threshold (e.g., Tenure < 6 months)
- Segment-based Retention Tactics (e.g., discounts, upgrades)
- Churn Risk Score (if predictive model used)
